

STUDENT OPPORTUNITY MATCHER

UniPath Career Sync

B.Tech Mini Project Documentation

Development Platform: Base44 AI

Project Type: AI-Assisted Web Application

Live Application: <https://unipath-career-sync.base44.app>

Version Control: Git & GitHub

1. Abstract

Student Opportunity Matcher – UniPath Career Sync is a web-based platform designed to help students discover relevant career opportunities such as internships, jobs, hackathons, scholarships, workshops, and competitions from a centralized platform. Students often miss valuable opportunities because information is distributed across multiple websites and platforms. The proposed system provides a personalized dashboard where students can create profiles and discover opportunities based on branch, technical skills, interests, preferred location, and career objectives. The application is developed with AI-assisted web development using Base44 AI.

2. Introduction

B.Tech students have access to a large number of internships, jobs, hackathons, scholarships, workshops, and technical competitions. However, these opportunities are generally distributed across different websites, company pages, college groups, and social platforms. UniPath Career Sync addresses this fragmentation by providing a centralized platform for discovering relevant opportunities.

3. Problem Statement

Students miss internships, hackathons, scholarships, jobs, workshops, and competitions because career opportunities are scattered across different websites and platforms. There is a need for a centralized system that can identify and present relevant opportunities according to a student's branch, technical skills, interests, preferred location, and career goals.

4. Proposed Solution

UniPath Career Sync allows students to create a profile containing academic details, technical skills, interests, preferred location, and career goals. The application presents relevant opportunities and provides search, filtering, categorization, and personalized matching functionality.

5. Objectives

1. Create a centralized platform for student opportunities.
2. Reduce the time required to search for career opportunities.
3. Provide personalized opportunity recommendations.
4. Filter opportunities based on branch and skills.
5. Help students discover internships and jobs.
6. Provide information about hackathons and competitions.
7. Demonstrate AI-assisted web development using Base44 AI.
8. Maintain the project using Git and GitHub.

6. Target Users

The primary users are B.Tech students, internship seekers, job seekers, hackathon participants, scholarship seekers, and students interested in technical workshops and competitions. The platform can also be extended for colleges, companies, startups, and event organizers.

7. Main Features

Student Profile: Academic details, branch, year, skills, interests, location and career preferences.

Opportunity Dashboard: Centralized display of opportunities.

Categories: Jobs, internships, hackathons, scholarships, workshops and competitions.

Search and Filter: Search by category, skill, branch, location, eligibility and deadline.

Personalized Matching: Compare student information with opportunity requirements.

Deadline Tracking: Display important application deadlines.

8. System Architecture

Student → Web Interface → Student Profile → Matching Engine → Opportunity Data → Recommendations → Student Dashboard

9. Technology Stack

Base44 AI; web technologies generated/managed through the platform; database support provided by the application platform; Git; GitHub; modern web browser. Specific internal technologies should be listed from the actual Base44 export if source code is available.

10. Role of Base44 AI

Base44 AI is used to accelerate application development by assisting with user-interface generation, page creation, dashboard design, forms, navigation, application functionality, responsive layouts, and iterative feature improvements.

11. Modules

1. User Registration
2. Student Profile
3. Opportunity Management
4. Opportunity Matching
5. Search and Filtering
6. Recommendation Dashboard
7. Deadline Tracking
8. Responsive Web Interface

12. Functional Requirements

The system should allow users to register and log in, create and update profiles, enter technical skills and interests, select preferred locations, browse opportunities, search and filter opportunities, view opportunity details, identify matching opportunities, track deadlines, and access application links.

13. Non-Functional Requirements

Usability, performance, security, responsiveness, scalability, and reliability are the major non-functional requirements.

14. Advantages

Saves students' time; centralizes career opportunities; makes opportunity discovery easier; provides personalized recommendations; helps students discover opportunities they may otherwise miss; reduces manual searching; provides a student-friendly interface; and can be expanded to support additional career services.

15. Limitations

Opportunity data must be updated regularly. External opportunities may change or expire. Matching accuracy depends on the information provided by students. External websites may have different eligibility requirements. Automated opportunity collection may require additional APIs or integrations.

16. Future Scope

AI career assistant; resume analysis; skill-gap analysis; automated opportunity collection; email notifications; deadline reminders; AI interview preparation; personalized career roadmaps; and advanced job recommendation systems.

17. Testing

Registration — account/profile created.

Login — user enters dashboard.

Profile update — information updated.

Add skills — skills saved.

Search opportunity — relevant results displayed.

Category filter — selected category displayed.

Location filter — relevant locations displayed.

Opportunity details — complete information displayed.

Matching — suitable opportunities recommended.

Responsive testing — website works on different screen sizes.

20. Conclusion

UniPath Career Sync provides a practical solution to the problem of fragmented student career opportunities. By bringing opportunities into one student-focused platform and matching them with profile information, the application can help B.Tech students discover relevant career opportunities more efficiently. The project also demonstrates the practical use of AI-assisted web development with Base44 AI and version control using Git and GitHub.
